Introduction

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) has the Federal leadership for the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining, and distributing soil survey information for privately owned lands in the United States.

Soil Geographic Data Bases

SCS has established three soil geographic data bases representing kinds of soil maps. Each data base has a common link to an attribute data file for each map unit component. The soil interpretations record data base provides the attribute data for each geographic data base.

The three soil geographic data bases include the Soil Survey Geographic Data Base (SSURGO), the State Soil Geographic Data Base (STATSGO), and the National Soil Geographic Data Base (NATSGO). Components of map units in each data base are generally phases of soil series that enable the most precise interpretation. Interpretations are displayed differently for each geographic data base to be consistent with differing levels of detail. The soil interpretations record data base contains physical and chemical soil properties for approximately 18,000 soil series recognized in the United States.

The most detailed level of information is SSURGO, which was designed primarily for farm and ranch, landowner/user, township, county, or parish natural resource planning and management. Using the soil attributes, this data base serves as an excellent source for determining erodible areas and developing erosion control practices, reviewing site development proposals and land use potential, making land use assessments, and identifying potential wetlands and sand and gravel aquifer areas.

Using NCSS mapping standards, soil maps in the SSURGO data base are made using field methods. Surveyors observe soils along delineation boundaries and determine map unit composition by field traverses and transects. Aerial photographs are interpreted and used as the field map base. Maps are made at scales ranging from 1:12,000 to 1:62,500. Typically scales are 1:15,840, 1:20,000, or 1:24,000. The maps, along with comprehensive descriptions, produce an attribute and spatial data base for NCSS soil survey publications.

Line segments (vectors) are digitized in accordance with SCS-established specifications and standards for duplicating the original soil survey map. The mapping bases are normally orthophotoquads, and digitizing is performed by SCS or by cooperating Federal, State, and local governments.

Data for SSURGO are collected and archived in 7.5-minute topographic quadrangle units and distributed as complete coverage for a soil survey area usually consisting of 10 or more quadrangle units. The adjoining 7.5-minute units are matched within the survey areas.

The STATSGO was designed to be used primarily for regional, multi-state, river basin, State, and multicounty resource planning, management, and monitoring. STATSGO data are not detailed enough to make interpretations at a county level.

Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. Where more detailed soil survey maps are not available, data on geology, topography, vegetation, and climate are assembled, together with Land Remote Sensing Satellite (LANDSAT) images. Soils of like areas are studied, and the probable classification and extent of the soils is determined.

Map unit composition for STATSGO is determined by transecting or sampling areas on the more detailed maps and expanding the data statistically to characterize the whole map unit.

Using U.S. Geological Survey's (USGS) 1:250,000-scale, 1- by 2-degree quadrangle series as a map base, the soil data are digitized by line segment (vector) to comply with national guidelines and standards.

Data for STATSGO are collected and archived in 1- by 2-degree topographic quadrangle units and distributed as complete coverage for a State; and the adjoining 1- by 2-degree units are matched both within and between States.

The NATSGO is used primarily for national and regional resource appraisal, planning, and monitoring. The boundaries of the major land resource areas (MLRA) and regions were used to form the NATSGO data base [7].* The MLRA boundaries were developed primarily from State general soil maps.

Map unit composition for NATSGO was determined by sampling done as part of the 1982 National Resources Inventory [8]. Sample data were expanded for the MLRA's, with sample design being statistically significant to State parts of the MLRA's.

The NATSGO map was compiled on an SCS-adapted version of the 1970 Bureau of Census automated State and county map data base and it was digitized from the USGS 1:5,000,000-scale U.S. base map.

This document describes the STATSGO data, which provide national coverage at a scale of 1:250,000, except for Alaska, which is at a scale of 1:2,000,000.

*Bracketed numbers correspond to numbered reference list.

Using Soil Maps

A soil map in a soil survey is a representation of soil patterns in a landscape. The scale of the map and the complexity of the soil patterns determine what can be shown on the soil map. In designing soil surveys, the projected uses of the survey and the complexity of the soil patterns largely determine the scale of the soil map [5].

When using soil maps, remember that scale, accuracy, and detail are not synonymous. Scale is the relationship between corresponding distance on a map and the actual distance on the ground. Accuracy is the degree or precision with which map information is obtained, measured, and recorded, and detail is the amount of information shown.

Map scale, accuracy, and detail are interrelated. A large-scale map is not necessarily more accurate or more detailed than a small-scale map; however, it generally shows more detail than a small-scale map. Soil maps are made by using field investigation methods. The accuracy of the maps is determined by many factors, including the complexity of the soils, design of the soil map units, intensity of field observations and data collection, and skills of the mapper.

A soil map at 1:250,000 scale should not be used to locate soils for intensive land uses, such as determining suitability for house lots. It is useful for understanding the soil resources and for planning broad use in a State or region. A soil map at 1:20,000 scale is useful in understanding and planning the soil resources of fields, farms, and communities, but it is not useful for planning small (less than 1 acre) research plots. In many places the pattern of soils is very complex, and in some places soils grade imperceptibly to others. Because of this, soil delineations, even on large-scale maps, are not homogeneous or pure; thus, onsite investigations are needed to determine, for example, the suitability of a plot for a septic tank installation when using a soil map at scale of 1:20,000.

The common practice of enlarging soil maps does not result in more detailed or accurate maps. Soil survey maps enlarged to 1:12,000 scale from 1:20,000 scale are no more accurate or detailed than the original 1:20,000 map.

Many times the information on soil maps is transferred to other base maps at different scales, which diminishes the new map's accuracy, especially if the base map is not planimetrically correct.

Soil interpretive maps for specific uses are commonly made from the soil maps. These kinds of maps are single purpose and have the same credibility and limitations as the soil maps from which they are made.

It is important to recognize the different kinds of soil maps, know their merits and limitations, and understand the relationship of map scale, accuracy, and detail.

Use of STATSGO Data

STATSGO Interpretive Maps

In a detailed (SSURGO) soil map, each map unit is usually represented by a single soil component, typically a soil series phase. Some SSURGO map units may have up to three named components. An interpretive map is normally made by classifying each unit according to the set of soil properties for a single component. On a STATSGO map, in contrast, each map unit contains up to 21 components for which there are attribute data, but there is no visible distinction as to the location of these components within the delineation. Thus, to present information on an attribute, a series of maps must be used to portray the more complex set of available information.

The legend for STATSGO interpretive maps commonly shows the percentage of the map unit that meets a criterion or criteria. (See page 8.) Care must be used in evaluating the statistics presented in such a legend. Percentage ranges given represent all delineations in that class and do not represent an individual STATSGO delineation. Percentages do not statistically represent a subset of the delineation, for instance, a county portion. They also do not represent the areas of the soil components that satisfy the criterion. However, the area of each map unit component is recorded in the data base and can be used to produce a table, even though the components cannot be displayed directly on the map.

Using STATSGO Data With Other Data

When STATSGO data are overlaid with other data such as land use data, statistics on the co-occurrence of the land use data with the soil data must be interpreted carefully. The composition of the STATSGO map unit can be characterized independently for the land use and for the soil component, but there are no data on their joint occurrence at a more detailed level. Analysis of the overlaid data should be on a map polygon basis. It would be incorrect to assign land use attributes to the soil components by multiplying the proportions of soil components by the proportions of land uses.

Additional political, watershed, or other boundaries may be intersected with the soil data. Although the composition of each political and watershed unit may be described in terms of the STATSGO map units, information is not available to assign the components to the boundary units with full accuracy. As with the land use categories, the analysis should be restricted to the classified components.

Visual orientation can be provided by using additional data files. For STATSGO interpretative maps and many natural resource purposes, a shaded relief background can provide visual reference of the topography that is easily understood. An example is the shaded relief background image from USGS Digital Elevation Model data, which is

formatted in 1:250,000-scale, 1- by 2-degree quadrangles [2]. Other data types, such as USGS Digital Line Graph for transportation or hydrography, can be used to help orient a reader to a map [4]. If transportation or hydrography data need to be incorporated into an analysis, it may be desirable to create a buffer zone around the linear feature and then use an overlay operation to intersect the resulting corridor area with the interpreted soil map.

Complex models can be constructed using the soil attribute data in conjunction with other data sources. The model output can be displayed in map form using a geographic information system. Examples include soil erosion, soil leaching potential, and land use suitability models. Calculations are typically made on the basis of each component soil phase. For example, in an erosion model, the slope and erodibility (k-factor) are extracted for each soil phase. The results of the calculation for each component can then be displayed in map form using the percentage composition techniques discussed earlier [1].

Analysis of STATSGO Data

In STATSGO, each map unit can have multiple components and each component can have multiple layers (fig. 1). Therefore, the analysis must begin at the lowest level in the schema and work back to the highest level. The order from the bottom to the top is layer, comp (component), and map unit tables. The layer table is related to the comp table by muid (map unit identifier) and seqnum (sequum number), which is the component number. The comp table is related to the map unit table by muid and the map unit table is related to the map data by muid. Other tables such as compyld (component yield), interp (interpretation), plantcom (plant community), rsprod (range site productivity), taxclass (taxonomic class), windbrk (windbreak), wlhabit (wildlife habitat), and woodmgt (woodland management) are on the same level with comp and relate to the comp table with muid and seqnum.

Since there are several layers in the layer table for each component in the comp table, a decision must be made as to how the data should be handled. One method is to select the surface layer for organic matter which has a low and a high value that can be averaged ($oml + omh/2$). Another method is to aggregate the data in the layers. Available water capacity is an example. Once again, there is a low and high value that can be averaged, multiplied by the layer thickness, and then summed, reducing a many-to-one relationship to a one-to-one relationship. An example of layer aggregation follows. Layer@ holds the results from the weighted average and the sum is shown in layer@ at the bottom of each component.

Figure 1.—STATSGO MAP UNIT

- 1/ STATSGO map units consist of 1 to 21 components.
- 2/ For each component, there are 60 soil properties and interpretations in 84 different data elements (component tables); for example, flooding.
- 3/ There are 1-6 soil layers for each component.
- 4/ There are 28 soil properties for each layer; for example, percent clay.
- 5/ A symbol created by concatenation of the two-character State FIPS code and a three-digit Arabic number. It uniquely identifies a map unit within a State.

LAYER TABLE (selected attributes and four components in muid KS001)

muid	seqnum	layernum	laydepl	laydeph	awcl	awch	layer@
KS001	1	1	0	10	0.22	0.24	2.3
KS001	1	2	10	40	0.18	0.20	5.7
KS001	1	3	40	60	0.20	0.22	<u>4.2</u>
							12.2
KS001	2	1	0	15	0.10	0.12	1.7
KS001	2	2	15	25	0.08	0.10	0.9
KS001	2	3	25	68	0.08	0.10	<u>3.9</u>
							6.5
KS001	3	1	0	10	0.08	0.10	0.9
KS001	3	2	10	20	0.10	0.14	<u>1.2</u>
							2.1
KS001	4	1	0	15	0.20	0.24	3.3
KS001	4	2	15	25	0.22	0.24	<u>2.3</u>
							5.6

The layer table is related to the comp table by muid and seqnum and the sum of the weighted average is calculated into comp@ in the comp table from layer@ in the layer table. The sum of the weighted average is the total inches of water available in the soil profile. Next, a category code that is based on the sum of the weighted averages is assigned. Available water capacity categories commonly used by SCS [3] are as follows:

1 very low	0 to 3 inches
2 low	3 to 6 inches
3 moderate	6 to 9 inches
4 high	9 to 12 inches
5 very high	>12 inches

A category code is assigned beginning with 1 for "very low" and ending with 5 for "very high." Comp@1 in the following comp table shows the results. For example, in muid KS001, which consists of four components, 40 percent of the map unit would be in category 5, 30 percent in category 3, 20 percent in category 2, and 10 percent in category 1. None of the components falls into category 4.

COMP TABLE (selected attributes)

muid	seqnum	comp@	comp@1	comppct
KS001	1	12.2	5	40
KS001	2	6.5	3	30
KS001	3	2.1	1	10
KS001	4	5.6	2	20

The next step is to aggregate the sum of the comppts (component percents) for each category by muid into the map unit table. Once again, there is a many-to-one relationship. With STATSGO data, it is impossible to display all of the results of the analyses on one map, so a series of maps is generated, one for each category. Since five categories have been defined for available water capacity, up to five maps may be generated. The comp table is related to the map unit table by muid, and the sum of the comppts will be moved into pct1, pct2, pct3, pct4, and pct5 in the map unit table. Pct1 corresponds to category 1 and pct5 corresponds to category 5.

MAP UNIT TABLE (selected attributes)

muid	pct1	pct2	pct3	pct4	pct5
KS001	10	0	50	0	40

The legend for STATSGO maps is commonly in terms of percent of the map unit that meets a criterion or criteria. In this example, four classes are defined as follows:

0 to 25 percent	51 to 75 percent
26 to 50 percent	76 to 100 percent

A class code is assigned to each of the four classes defined above, beginning with 1 for "0 to 25 percent" and ending with 4 for "76 to 100 percent." If water areas are included in the map data, then water could be assigned a class code of 5. The results of applying the classes to the data in pct1 through pct5 are shown in map1 through map5 as follows.

MAP UNIT TABLE (selected attributes)

muid	pct1	pct2	pct3	pct4	pct5	map1	map2	map3	map4	map5
KS001	10	0	50	0	40	1	1	2	1	2

The map unit table is related to the map data by muid and the codes in map1 through map5 are moved to the map data. The results are shown in the following table. The codes can then be linked to a color lookup table for the polygon shading on the map.

MAP DATA TABLE (selected attributes)

muid	map1	map2	map3	map4	map5
KS001	1	1	2	1	2

This is a brief description of how one attribute at the layer table level is handled. Even though the logic is the same, the process becomes more complicated when several attributes from different tables are being evaluated. An example would be pesticide leaching potential that would involve organic matter and surface layer thickness from the layer table and hydrologic groups from the comp table.

Data Collection

Specifications Used for Compiling STATSGO

Compilation Procedures

Draft soil map unit lines using available references such as soil survey maps, published and unpublished; county general soil maps; State general soil maps; State major land resource area (MLRA) maps; and LANDSAT images.

Draft soil map unit lines and symbols in red pencil on the Mylar overlay, which is punch-registered to fit the USGS base map Mylar. Do not transfer the USGS border neatline to the overlay as it will be added during the digitizing process. The pencil intensity should be consistent to facilitate scanner digitizing.

Map Units

Map unit delineations.--Approximate minimum area to be delineated is 625 hectares (1,544 acres), which is represented on a map of 1:250,000 scale by an area appropriately 1 cm by 1 cm (0.4 inch by 0.4 inch). Linear delineations should not be less than 0.5 cm (0.2 inch) in width. The number of delineations per 1:250,000 quadrangle should range from 100 to 200, but a range of up to 400 is allowed.

Map unit delineations must join at State boundaries and composition of map units must be coordinated across State boundaries, not only in the identity, but also in the relative extent of each component.

Components. Map units should be a combination of associated phases of soil series. The information about map units is to include reliable estimates of the components and the percentage and method by which the composition is determined. Composition can be determined by transecting representative segments of map units in published or unpublished soil surveys and documenting component composition or by using acreage data in the map unit use file. Transects may be observed in the field; however, it is more likely that they will be located and examined on soil survey field sheets or in published soil surveys. A suggested procedure consists of four steps.

First, transects should be plotted on the general soil map so that they afford complete and representative coverage of the respective map unit. Plot transects on published soil survey atlas sheets or unpublished soil survey field sheets so that they cut across the more detailed delineations that make up the corresponding map unit on the general soil map. Based on the judgment of the soil scientist, they should be located to intersect delineations of soils most representative of the map unit when subsequently plotted on the published atlas sheets or field sheets for measuring. Generally, transects are located at right angles to drainage patterns, include the complete range in elevation, and represent the typical landscape. Transects also include and represent uniform space across the delineated map

unit. All map units should be sampled by transects. The number of transects being used are proportional to the relative size, number, and complexity of the delineations. SCS State staffs should submit their verification procedures to their National Technical Center (NTC) with the compiled maps for review.

Then, on the atlas or field sheets, measure and record the length of the segments of each map unit along the transect crossing the detailed soil map.

Next, combine data on segment lengths for all delineations of each map unit. Using routine correlation procedures, determine which map components from the atlas or field sheets can be combined and make combinations so that not more than 21 phases of soil series or comparable detailed units are identified as components of the map unit on the general soil map.

Finally, determine the percentage of the general soil map unit occupied by each component by the percentage of the total length of the transects crossing the area of the general soil map unit.

Procedures Used for Digitizing STATSGO

The following map features are digitized and named line features: soil boundaries, map neatline, water boundaries (shoreline), and State boundary. Point features include soil map symbols (the 2-alpha character State code followed by a 3-digit-Arabic number code beginning with 001), e.g., KS001.

Soil boundaries. Digitize all soil boundaries within a .010-inch line width following the center line of the original soil boundary. Represent each soil boundary with no greater number of coordinate pairs than is necessary within the .010-inch accuracy limit.

All beginning and ending points of each digitized line will either:

- (1) Connect as a common point of intersection with another soil boundary, water boundary, limit of soil survey boundary, or the map neatline; or
- (2) In the case of an "island," which does not connect or intersect with another soil boundary, digitize as two lines, starting and ending at two independent coordinate points.

Limit of soil survey and water boundaries. Limit of soil survey and water boundaries must meet the same .010-inch accuracy standard as soil boundaries.

Map neatline. The map neatline is considered a soil boundary and forms the maximum extent of the digital data set. Construct the map neatline as four separate straight line boundary segments. The beginning and ending point of each neatline will be identical to the four corner coordinate values of the 1- by 2-degree quadrangle.

These values must be explicitly entered and not digitized. The 7.5-minute tic marks are also entered.

Soil boundaries intersecting the map neatline must have a common point of intersection and must not extend beyond or fall short of the map neatline.

Soil map symbols. The soil map symbols will be identical to those shown on the original soil map (e.g., PA001). Position the soil map symbol so that it begins within the soil area. Use the lower left corner of the first character of the symbol as the test origin.

Soil areas missing a soil map symbol should be labeled "XXX" until the symbol is determined. Areas outside the limit of the soil survey boundary but within the neatline are to be named "NODATA." Water areas are to be named "W" and to be preceded by the State code (e.g., PAW).

Edge matching. The soil boundaries ending at all four edges of each quadrangle should be computer-joined to any adjoining map sheets to achieve an exact match. However, if this is not possible due to system limitations, match the soil boundaries on the adjoining quadrangles within .010 inch, center line to center line. Check the adjoining map sheets before digitizing and revise, if necessary, to ensure that lines and boundaries match.

Acreage calculations. Develop acreage calculations and a total polygon count for each soil map data set on each 1:250,000 quadrangle.

Print a computer-generated hard copy of the accurate calculations from each soil map data set. Sort the records by soil map symbol, water, and blank or NODATA. Show the acreages to the nearest acre, as shown below:

PA001	27,081
PA002	2,371
PA003	289,688
NODATA	3,067
PAW	532
Total Acres	-----
Total Polygons	----

Calculate the total acreage within the map neatline, including the areas outside the limit of the soil survey that are labeled Blank or NODATA, and summarize the acreages.

Editing. A complete and detailed edit of the digitizing work is required. The State soil scientist is responsible for ensuring that the digital soil data match the original soil survey. The digitized soil data must be carefully checked against the original soil maps to ensure that all data are correctly and completely digitized.

(1) Generate the check plot with either ball pen (standard point) or wet ink, using a .010-inch line width on Mylar material. Plot all data within .005 inch of its coordinate location in the data base.

(2) Plot soil map symbols as a line of single-stroke characters, height and width of 0.10 inch. The soil map symbols should duplicate the sequence of the original soil maps. The digital origin points for the soil map symbols shall not appear on the check plots.

(3) Plot soil boundaries, neatlines, limit of soil survey boundaries, and soil map symbols in black; water boundaries and water area names in blue; and special soil features and labels in green. Soil symbols that are unidentifiable and labeled as XXX are to be plotted in red.

(4) Label the check plot with the appropriate data set name and plotting scale at some point beyond the data set limits.

(5) Check plots are to be free of dirt, smudges, scratches, and other defects.

Quality Control

Check plot requirements. Plot a computer check plot for each digitized soil map data set at the same scale and map projection as the original soil map sheet. The check plots are to accurately represent the data on the magnetic tape data sets.

A complete preliminary edit should be completed of the first two adjoining maps, digitized and forwarded to the SCS National Cartographic Center (NCC) for its review. Materials needed are:

- The check plots
- The digital data sets on magnetic tape
- One summary acreage calculation with a total polygon count for each map sheet
- All of the original source materials

Data Structure

Spatial Data

Identification codes and labels. The following identification codes and special soil feature labels are used for the line, point, and feature data files:

TYPE FILE	DESCRIPTION	FEATURE LABELS
Line	Soil boundary	---
Line	Water boundary	---
Line	Map neatline	---
Line	Edge of Coverage	---
Point	Soil map symbol	PA001
	Water	PAW
	Area beyond coverage	NODATA or BLANK

"---" means not applicable.

A soil map data set corresponds to one 1:250,000 quadrangle area and consists of up to three separate files produced in consecutive order as follows:

- (1) Header file
- (2) Line file
- (3) Point file

A file contains multiple records and is considered at end when an end-of-file mark is found.

Header file. Describes the contents of the data set for reference purposes. Each digital data set is identified within the header file, using the name of the quadrangle map. The header file does not require the extraction of data from other files.

Line file. Contains soil and water boundaries, limit of soil survey boundaries, and map neatlines.

Point file. Contains locations for soil map symbols and special soil point feature labels.

Data file format (USGS Digital Line Graph Optional [DLG-3 optional]). Stores and exchanges digital soil map data.

ASCII Symbol Conversion file. Follows each map data set if the DLG-3 optional file does not contain major/minor pairs. One record is required for each area in the following format:

1. PA005
2. PAW
3. PA039

If the DLG-3 optional file contains major/minor pairs, an ASCII symbol conversion file will follow the last map data set on the tape or will reside on a separate tape. Similar map units in the map sets will have the same minor code, so the symbol conversion file will be a universal conversion legend with the following format:

1. PA001
2. PA002
3. PA003

Data Voids

Attribute data for some data elements may be incomplete or missing for certain portions of the United States. For example, data were not available for forest and range productivity for some STATSGO map units on U.S. Department of Agriculture Forest Service lands in some Western States. In instances where data are unavailable, a mask should be used to exclude the area from analysis.

Map Hard Copy Production

Maps that use SCS STATSGO data must show the source and date. The maps should also contain the following notation:

"The soil information used for this map was Soil Conservation Service 199_ STATSGO data. STATSGO was compiled at 1:250,000 and designed to be used primarily for regional, multistate, State, and river basin resource planning, management and monitoring."

User Support

The user should be knowledgeable of soils data. If you need assistance, contact an SCS soil scientist for help. The following is a listing of SCS State soil scientist addresses and telephone numbers:

665 Opelika Rd.
P.O. Box 311
Auburn, AL 36830
(205) 821-0250

655 Parfet Street, Rm. E200C
Lakewood, CO 80215-5517
(303) 236-2910

201 East 9th, Suite 300
Anchorage, AK 99501-3687
(907) 271-2424

16 Professional Park Rd.
Storrs, CT 06268-1299
(203) 487-4047

Distribution

Source

National Cartographic Center
U.S. Department of Agriculture
Soil Conservation Service
P.O. Box 6567
Fort Worth, TX 76115
(817) 334-5559

Format

The STATSGO spatial data are available in USGS Digital Line Graph (DLG-3) optional format. Map unit symbols (e.g., PA001) are not normally carried within the DLG-3 Optional formatted data; however, these map symbols are made available as a separate and unique ASCII file.

The STATSGO attribute data are stored in a relational data base format which is a nonfixed-length, tab-delimited ASCII file.

The SCS National Cartographic Center (NCC) operates a Geographic Resource Analysis Support System (GRASS) Geographic Information System (GIS) and an ARC/INFO GIS. SCS-GRASS and other formats may be made available by mutual agreement.

The STATSGO spatial and attribute data are distributed as one data set and are stored by USGS 1:250,000 1- by 2-degree quadrangle and distributed for a full State.

Medium

The distribution medium for spatial and attribute data will normally be 9-track magnetic tape at 1600 bits per inch, but may be cartridge tape by mutual agreement.

Ordering

Before ordering STATSGO data, the user needs to identify the State(s) of interest and may wish to consult a USGS index to the 1:250,000 base map series to ensure coverage. Additional information and costs may be obtained from NCC.

The STATSGO data are periodically updated, data files are dated, and users are responsible for obtaining the latest version.

Appendix

Data Dictionary Part I Definition of Soil Data Elements

ELEMENT	TABLES	LONG NAME	DESCRIPTION
aashind	layer	AASHTO Group Index	AASHTO (American Assoc. of State Highway and Transportation Officials) group index. A modification to AASHTO group classification of a soil.
aashto	layer	AASHTO Group Classification	AASHTO (American Assoc. of State Highway and Transportation Officials) group classification. A code for AASHTO group classification for a soil.
anflobeg	comp	Annual Flooding Month Begin	Month in which annual flooding (flooding likely to occur during the year) begins in a normal year.
anflodur	comp	Flood Duration Class	The duration of annual flooding in a normal year.
anfloend	comp	Annual Flooding Month End	Month in which annual flooding (flooding likely to occur during the year) ends in a normal year.
anflood	comp	Annual Flooding Frequency	Descriptive term used to describe the frequency of annual flooding (flooding likely to occur during the year) that is likely to occur Frequent (FREQ) - > 50% chance of flooding; Occasional (OCCAS) - 5-50% chance of flooding; Rare (RARE) - 0-5% chance of flooding.
awch	layer	Available Water Capacity	Maximum value for the range of available water capacity for the soil layer or horizon expressed as inches/inch.

awcl	layer	Available Water Capacity	Minimum value for the range of available water capacity for the soil layer or horizon, expressed as inches/inch.
bdh	layer	Bulk Density	Maximum value for the range in moist bulk density of the layer or horizon, expressed as grams per cubic centimeter.
bdl	layer	Bulk Density	Minimum value for the range in moist bulk density of the soil layer or horizon, expressed as grams per cubic centimeter.
caco3h	layer	Carbonate as CaCO ₃	Maximum value for the range of calcium carbonate (CaCO ₃) in the soil layer or horizon, expressed as a percent.
caco3l	layer	Carbonate as CaCO ₃	Minimum value for the range of calcium carbonate (CaCO ₃) in the soil layer or horizon, expressed as a percent.
cech	layer	Cation Exchange Capacity	Maximum value for the range in cation exchange capacity for the soil layer or horizon.
cecl	layer	Cation Exchange Capacity	Minimum value for the range in cation exchange capacity for the soil layer or horizon.
clascode	comp taxclass	Taxonomic Classification Code	Code for the taxonomic classification for the soil. Definitions of codes are in the taxclass table.
class	taxclass	Taxonomic Classification	The taxonomic classification (name) of the soil.
clayh	layer	Clay	Maximum value for the range or horizon, expressed as a percentage of the material less than 2 mm in size.
clayl	layer	Clay	Minimum value for the range in clay content of the soil layer or horizon, expressed as a percentage of the material less than 2 mm in size.

clirr	comp	Irrigated Capability Class	Irrigated Capability Class. A rating of the soil for irrigated agricultural use. The number indicates progressively greater limitations and narrower choices for use.
clnirr	comp	Nonirrigated Capability Class	Nonirrigated Capability Class. A rating of the soil for nonirrigated agricultural use. The number indicates progressively greater limitations and narrower choices for use.
comname	plantnm	Plant Common Name	The common name for the plant most widely used by the State.
compkind	comp	Kind of Component	Code identifying the kind of component of the map unit. Example: Series (S); Family (F); Variant (V); Taxadjunct (T); Taxon above family (G); Miscellaneous area (M).
comppct	comp	Component Percent	The percentage of the component of the map unit.
corcon	comp	Corrosion - Concrete	An interpretation rating of the susceptibility of concrete to corrosion when in contact with the soil.
corsteel	comp	Corrosion - Uncoated Steel	An interpretation rating of the susceptibility of uncoated steel to corrosion when in contact with the soil.
cropname	compyld yldunits	Crop Name	The common name for the crop , for which a yield is given.

drainage	comp	Soil Drainage Class	Code identifying the natural drainage condition of the soil and referring to the frequency and duration of periods when the soil is free of saturation. Example: Well Drained (W); Excessive (E); Moderately Well (MW); Poorly (P); Somewhat Excessively (SE); Somewhat Poorly (SP).
frostact	comp	Potential Frost Action	An interpretation rating of the susceptibility of the soil to frost heaving.
grpcode	interp	Interpretative Group Code	Code identifying the interpretive group or category for the interpretation specified. Examples of interpretive groups are septic tank absorption fields and shallow excavations.
grtgroup	taxclass	Great Group	Code for the taxonomic GREAT GROUP category.
gsflobeg	comp	Growing Season Flooding Begins	Month in which growing season (season for common field crops in the area) flooding begins in a normal year.
gsflodur	comp	Growing Season Flood Duration	The duration of flooding during the growing season (season for common field crops in the area).
gsfloend	comp	Growing Season Flooding Ends	Month in which growing season (season for common field crops in the area) flooding ends in a normal year.
gsflood	comp	Growing Season Flooding Frequency	Term describing the frequency of flooding during the growing season (season for the common field crops in the area). Frequent (FREQ); Occasional (OCCAS); Rare (RARE).

gypsumh	layer	Gypsum	Maximum value for the range in sulfates reported as gypsum (CaSO ₄) in the soil layer or horizon, expressed as a percent.
gypsuml	layer	Gypsum	Minimum value for the range in sulfates reported as gypsum (CaSO ₄) in the soil layer or horizon, expressed as a percent.
hydgrp	comp	Hydrologic Group	The hydrologic group for the soil. Example: A, A/D.
hydric	comp	Hydric Soil Rating	The symbol (Y/N) identifying hydric soils.
inch10h	layer	Weight Percent Greater than 10 in.	The maximum value for the range in percent by weight of the rock fragments greater than 10 inches in size in the soil layer or horizon.
inch10l	layer	Weight Percent Greater than 10 inches.	The minimum value for the range in percent by weight of the rock fragments greater than 10 inches in size in the soil layer or horizon.
inch3h	layer	Weight Percent 3 to 10 inches	The maximum value for the range in percent by weight of the rock fragments 3 to 10 inches in size in the soil layer or horizon.
inch3l	layer	Weight Percent Material 3 to 10 inches	The minimum value for the range in percent by weight of the rock fragments 3 to 10 inches in size in the soil layer or horizon.
irryld	compyld	Irrigated Crop Yield	The expected yield of the specific crop with irrigation in an average year under a high level of management.

kfact	layer	Soil Erodibility Factor	An erodibility factor which quantifies the susceptibility of soil particles to detachment and movement by water. This factor is used in the Universal Soil Loss Equation to calculate soil loss by water.
kffact	layer	Soil Erodibility Factor, rock fragments free	An erodibility factor which quantifies the susceptibility of soil particles to detachment and movement by water. This factor is used in the Universal Soil Loss Equation to calculate soil loss by water.
laydeph	layer	Layer Depth	The depth to the lower boundary of the soil layer or horizon, expressed in inches.
laydepl	layer	Layer Depth	Depth to the upper boundary of the soil layer or horizon, expressed in inches.
layerid	layer	Layer Identification Number	A convention to identify the original layers on the SOI-5 record. Example: layerid 11 for the first surface of a multisurface record, 12 for the second surface layer, 2 thru 9 for subsurface layers.
layernum	layer	Layer Number	The sequence number identifying layers in the soil profile. A layer number of 1 would indicate the layer is the surface layer.
1lh	layer	Liquid Limit	The maximum value for the range in liquid limit of the soil layer or horizon, expressed as percent moisture by weight.
1ll	layer	Liquid Limit	The minimum value for the range in liquid limit of the soil layer or horizon, expressed as percent moisture by weight.

minalogy	taxclass	Mineralogy	Code for the MINERALOGY class of the Family category of taxonomic classification.
mlra	map unit	Major Land Resource Area	The code used to identify the dominant Major Land Resource Area (MLRA) within which the soil map unit is mapped.
muacres	map unit	Map unit Acres	The acreage of the soil map unit in the State.
muid	comp compyld forest interp layer map unit plantcom rsprod windbrk wlhabit woodland woodmgt	Map unit Identification Symbol	A symbol created by concatenation of the two-character State FIPS code and a three-digit Arabic number. It uniquely identifies a map unit within a State. For example, the first map unit identified in Delaware is DE001. The muid is used as a key for linking information in the MUIR tables.
mukind	map unit	Map unit Kind	Code identifying the kind of map unit: Consociation (C); Association (A); Undifferentiated Group (U); Complex (X).
nirryld	compyld	Nonirrigated Crop Yield	The expected yield of the specific crop without supplemental irrigation. Defined as the yield expected in an average year under a high level of management.
no10h	layer	Percent Passing Sieve No. 10	The maximum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 10 sieve.
no10l	layer	Percent Passing Sieve No. 10	The minimum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 10 sieve.

no200h	layer	Percent Passing Sieve No. 200	The maximum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 200 sieve.
no200l	layer	Percent Passing Sieve No. 200	The minimum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 200 sieve.
no40h	layer	Percent Passing Sieve No. 40	The maximum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 40 sieve.
no40l	layer	Percent Passing Sieve No. 40	The minimum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 40 sieve.
no4h	layer	Percent Passing Sieve No. 4	The maximum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 4 sieve.
no4l	layer	Percent Passing Sieve No. 4	The minimum value for the range in percent by weight of the soil material in a layer or horizon which is less than 3 inches in size and passes a No. 4 sieve.
omh	layer	Organic Matter	The maximum value for the range in organic matter content of the soil layer or horizon, expressed in percent by weight.
oml	layer	Organic Matter	The minimum value for the range in organic matter content of the soil layer or horizon, expressed in percent by weight.

order	taxclass	Order	Code for the taxonomic ORDER category of the record.
ordsym	woodmgt	Ordination Symbol	The ordination symbol is the class and subclass part of the woodland suitability group. The first element in ordination symbol is the productivity class. This is a number that denotes potential productivity in cubic meters of wood per hectare per year for an indicator tree (1m ³ /ha is equal to 14.3 ft. ³ /ac.). The second part of the ordination is the subclass, a capital letter symbol which indicates certain soil or physiographic characteristics that contribute to important hazards or limitations in management. Example: Excessive wetness (W); Clayey soils (C), etc.
otherfam	taxclass	Other Family	This field consists of OTHER FAMILY codes for soil depth class, slope class, consistence class, classes of coatings and classes of cracks of the Family category of taxonomic classification.
otherph	comp	Class-Determining Phase Criteria	Class-determining phase criteria, other than slope and texture, recorded on the SOI-6 and used to select appropriate interpretation and rating from the SOI-5 record.
pandeph	comp	Depth to Cemented Pan	Maximum value for the range in depth to the upper boundary of a cemented pan, expressed in inches.
pandeph1	comp	Depth to Cemented Pan	Minimum value for the range in depth to the upper boundary of a cemented pan, expressed in inches.

panhard	comp	Cemented Pan Thickness	The degree of induration and thickness of the cemented pan. A pan is rated as "THICK" if it is more than 3 inches thick and continually indurated or more than 18 inches thick and discontinuous or fractured. Pans not meeting these criteria are rated THIN.
partsize	taxclass	Particle Size	Code for the PARTICLE-SIZE class of the Family category of taxonomic classification.
permh	layer	Permeability Rate	The maximum value for the range in permeability rate for the soil layer or horizon, expressed as inches/hour.
perml	layer	Permeability Rate	The minimum value for the range in permeability rate for the soil layer or horizon, expressed as inches/hour.
phh	layer	Soil Reaction (pH)	The maximum value for the range in soil reaction (pH) for the soil layer or horizon.
phl	layer	Soil Reaction (pH)	The minimum value for the range in soil reaction (pH) for the soil layer or horizon.
pih	layer	Plasticity Index	The maximum value for the range in plasticity index for the soil layer or horizon, expressed as percent of moisture by weight.
pil	layer	Plasticity Index	The minimum value for the range in plasticity index for the soil layer or horizon, expressed as percent of moisture by weight.
plantcov	forest	Plant Ground Cover	The percentage of the ground covered by the plant (forest understory).
plantpct	plantcom	Plant Production Percentage	The percentage of total site production attributed to the specified plant, expressed as percent of air-dry plant material weight.

plantsym	forest plantcom plantnm windbrk woodland	Plant Symbol	Symbol used to identify a specific plant.
pndbeg	comp	Ponding Begin	Month in which soil surface ponding begins in a normal year.
pnddeph	comp	Ponding Depth	The maximum value for the range in depth of surface water ponding on the soil.
pnddepl	comp	Ponding Depth	The minimum value for the range in depth of surface water ponding on the soil.
pnddur	comp	Ponding Duration	The duration of surface water ponding.
pndend	comp	Ponding End	Month in which surface water ponding ends in a normal year.
primfml	comp	Prime Farmland Classification	The prime farmland classification of a component.
prodfav	rsprod	Range Production Favorable	The estimated annual potential production of range forage for the soil in a year with favorable or above average growing conditions.
prodnorm	rsprod	Range Production Normal	The estimated annual potential production of range forage for the soil in a year with normal or average growing conditions.
produnfv	rsprod	Range Production Unfavorable	The estimated annual potential production of range forage for the soil in a year with unfavorable or below average growing conditions.
rating	interp	Soil Interpretative Rating	Rating of soil for specified use. Suitability ratings are good, fair, and poor. Limitation ratings are slight, moderate, and severe.

reaction	taxclass	Reaction	Code for the REACTION class of the Family category of taxonomic classification.
restct1	interp	First Restrictive Feature Code	The key phrase which indicates the feature causing the problem.
restct2	interp	Second Restrictive Feature Code	The key phrase which indicates the feature causing the problem.
restct3	interp	Third Restrictive Feature Code	The key phrase which indicates the feature causing the problem.
rockdeph	comp	Depth to Bedrock	The maximum value for the range in depth to bedrock, expressed in inches.
rockdepl	comp	Depth to Bedrock	The minimum value for the range in depth to bedrock, expressed in inches.
rockhard	comp	Bedrock Hardness	The degree of hardness of the underlying rock. Rated as: HARD - Excavation requires blasting or special equipment, or SOFT - Excavation can be made with trenching machines, backhoes, or small rippers.
rsid	rsprod	Range Site Identification	Code used to identify the SCS range site.
rsname	rsprod	Range Site Name	Name for the SCS range site.
salinh	layer	Salinity	The maximum value for the range in soil salinity of the soil layer or horizon measured as electrical conductivity of the soil in a saturated paste. Values are expressed in mmhos/cm.
salinl	layer	Salinity	The minimum value for the range in soil salinity of the soil layer or horizon measured as electrical conductivity of the soil in a saturated paste. Values are expressed in mmhos/cm.

sarh	layer	Sodium Absorption Ratio	The maximum value for the range in Sodium Absorption Ratio (SAR) for the soil layer or horizon.
sarl	layer	Sodium Absorption Ratio	The minimum value for the range in Sodium Absorption Ratio (SAR) for the soil layer or horizon.
sciname	plantnm	Scientific Plant Name	The scientific name of a plant.
sclirr	comp	Irrigated Capability Subclass	Irrigated Capability Subclass. Concatenation of capability class and subclass codes: Example: class 2 and subclass e are combined and entered as 2E.
sclnirr	comp	Nonirrigated Capability Subclass	Nonirrigated Capability Subclass. Concatenation of capability class and subclass codes. Example: class 2 and subclass e are combined and entered as 2E.
seqnum	comp compyld forest interp layer plantcom rsprod windbrk wlhabit woodland woodmgt woodland woodmgt	Sequence Number	A number identifying the sequence of components in a map unit. The first component of a multitaxa map unit has a seqnum of 1, the second component 2, and so on. STATSGO map units can have up to 21 components.
shrinksw	layer	Shrink-Swell Potential	An interpretation rating of the soil layer or horizon's behavior of changing volume (shrinking and swelling) upon wetting and drying.

sitind	woodland	Site Index	The height in feet of the larger trees at some given age, normally 100 years in the Western United States, and 50 years in the East. The pinyon-juniper forest type is an exception, where the site index is determined by basal area.
slopeh	comp	Soil Slope	The maximum value for the range of slope of a soil component within a map unit.
slopel	comp	Slope of Soil	The minimum value for the range of slope of a soil component within a map unit.
soiltemp	taxclass	Soil Temperature	Code for the SOIL TEMPERATURE class of the Family category of taxonomic classification.
subgroup	taxclass	Subgroup	Code for the taxonomic SUBGROUP category of the record.
subinith	comp	Initial Subsidence	Maximum value for the range in initial subsidence that can be expected when drained, expressed in inches (organic soils only).
subinitl	comp	Initial Subsidence	Minimum value for the range in initial subsidence that can be expected when drained, expressed in inches (organic soils only).
suborder	taxclass	Suborder	Code for the taxonomic SUBORDER category of the record.
subtoth	comp	Total Subsidence	Maximum value for the range in total subsidence that can be expected when drained, expressed in inches (organic soils only).
subtotl	comp	Total Subsidence	Minimum value for the range in total subsidence that can be expected when drained, expressed in inches (organic soils only).

suitcode	woodland	Woodland Tree Suitability	Code indicating if the tree is common to the site, Existing (E); or a tree which could be planted as a tree crop Potential (P). Trees which are existing and have a potential for planting are given a dual code (EP).
surftex	comp	Surface Soil Texture	Code for the USDA texture or term used in lieu of texture for the surface layer. Example: sandy loam (SL).
texture	layer	Soil Texture Class	Code for the USDA texture for the specified layer or horizon of the soil. Example: Sandy Loam (SL); Loam (L).
tfact	layer	T Factor	Soil loss tolerance factor. The maximum rate of soil erosion that will permit a high level of crop production.
unified	layer	Unified Soil Classification	The unified soil classification. An engineering classification of soils.
wdequip	woodmgt	Woodland Equipment	Woodland limitation rating for the use of equipment, year round or seasonal.
wderosn	woodmgt	Woodland Erosion	Woodland limitation rating identifying the probability that damage may occur as a result of site preparation and following cutting operations where soil is exposed.
wdplant	woodmgt	Woodland Plant Competition	Woodland limitation rating for the likelihood of the invasion or growth of undesirable species when openings are made in the canopy.
wdseed	woodmgt	Woodland Seeding Mortality	Woodland limitation rating identifying the probability of death of naturally occurring or planted tree seedlings as influenced by kinds of soil or topographic conditions.

wdwind	woodmgt	Woodland Windthro Hazard	Woodland limitation rating identifying the windthrow hazard. Windthrow is the likelihood of trees being uprooted by wind as a result of insufficient depth of the soil to give adequate root anchorage.
weg	layer	Wind Erodibility Group	The wind erodibility group (weg) assigned to the soil layer or horizon.
wlconif	wlhabit	Wildlife Habitat Element (coniferous trees)	Suitability of the soil to produce the wildlife habitat element coniferous trees.
wlgrain	wlhabit	Wildlife Habitat Element (grain)	Suitability of the soil to produce the wildlife habitat element grain.
wlgrass	wlhabit	Wildlife Habitat Element (grass)	Suitability of the soil to produce the wildlife habitat element grass.
wlhard	wlhabit	Wildlife Habitat Element (hardwood trees)	Suitability of the soil to produce the wildlife habitat element hardwood trees.
wlherb	wlhabit	Wildlife Habitat Element (herbaceous plants)	Suitability of the soil to produce the wildlife habitat element herbaceous plants.
wlopen	wlhabit	Wildlife Habitat Potential (open land)	Suitability of the soil to produce the habitat requirements for open land wildlife.
wlrange	wlhabit	Wildlife Habitat Potential (rangeland)	Suitability of the soil to produce the habitat requirements for rangeland wildlife.
wlshlwat	wlhabit	Wildlife Habitat Element (shallow water)	Suitability of the soil to produce the habitat element shallow water.
wlshrub	wlhabit	Wildlife Habitat Element (shrub)	Suitability of the soil to produce the wildlife habitat element shrubs.

wlwet	wlhabit	Wildlife Habitat Potential (wetland)	Suitability of the soil to produce the habitat requirements for wetland wildlife.
wlwetplt	wlhabit	Wildlife Habitat Element (wetland plant)	Suitability of the soil to produce the wildlife habitat element wetland plants.
wlwood	wlhabit	Wildlife Habitat Potential (woodland)	Suitability of the soil to produce the habitat requirements for woodland wildlife.
wndbrkht	windbrk	Windbreak Tree Height	Windbreak tree height in feet at age 20.
woodprod	woodland	Production Class	Production class information for a specific tree measured in cubic meters per hectare per year (1 m ³ /ha = 14.3 ft. ³ /ac.).
wtbeg	comp	Water Table Begins	Month in which seasonal water table occurs at the depth specified in a normal year.
wtdeph	comp	Water Table Depth	Maximum value for the range in depth to the seasonally high water table during the months specified.
wtdepl	comp	Water Table Depth	Minimum value for the range in depth to the seasonally high water table during the months specified.
wtend	comp	Water Table Ends	Month in which seasonal water table subsides below the depth specified in a normal year.
wtkind	comp	Water Table Kind	The type of water table: Apparent (APPAR); Artesian (ARTES); Perched (PERCH).
yldunits	yldunits	Yield Units	The units used to record the yield for the specified crop.

Data Dictionary Part II Definition of Soil Data Codes

domid	code	codename	codedesc
-----	-----	-----	-----
aashto	A-1	Group Classification A-1	Granular materials (35% or less passing No. 200), Stone Fragments, Gravel and Sand.
aashto	A-2	Group Classification A-2	Granular materials (35% or less passing No. 200), Silty or Clayey Gravel and Sand.
aashto	A-3	Group Classification A-3	Granular materials (35% or less passing No. 200), Fine Sand.
aashto	A-4	Group Classification A-4	Silt-Clay Materials (more than 35% passing No. 200), Silty Soils.
aashto	A-5	Group Classification A-5	Silt-Clay Materials (more than 35% passing No. 200), Silty Soils.
aashto	A-6	Group Classification A-6	Silt-Clay Materials (more than 35% passing No. 200), Clayey Soils.
aashto	A-7	Group Classification A-7	Silt-Clay Materials (more than 35% passing No. 200), Clayey Soils.
cl	1	Capability Class -I	Soils in Class I have few limitations that restrict their use.
cl	2	Capability Class - II	Soils in Class II have some limitations that reduce the choice of plants or require moderate conservation practices.

cl	3	Capability Class - III	Soils in Class III have severe limitations that reduce the choice of plants or require special conservation practices, or both.
cl	4	Capability Class - IV	Soils in Class IV have very severe limitations that restrict the choice of plants, require very careful management, or both.
cl	5	Capability Class - V	Soils in Class V have little or no erosion hazard but have other limitations impractical to remove that limit their use.
cl	6	Capability Class - VI	Soils in Class VI have severe limitations that make them generally unsuited to cultivation and limit their use largely to pasture, etc.
cl	7	Capability Class - VII	Soils in Class VII have very severe limitations that make them unsuited to cultivation and that restrict their use to grazing, etc.
cl	8	Capability Class - VIII	Soils (and landforms) in Class VIII have limitations that preclude their use for commercial plant production and restrict their use.

compkind	F	Family	
compkind	G	Taxon above family	
compkind	M	Miscellaneous area	
compkind	S	Series	
compkind	T	Taxadjunct	
compkind	V	Variant	
drainage	E	Excessively	Water is removed very rapidly. Internal free water occurrence is commonly very deep; annual duration is not specified.
drainage	SE	Somewhat Excessively	Water is removed from the the soil rapidly. Internal free water occurrence is commonly very deep; annual duration is not specified.
drainage	W	Well	Water is removed from the soil readily, but not rapidly.
drainage	MW	Moderately Well	Water is removed from the soil somewhat slowly during some periods of the year.
drainage	SP	Somewhat Poorly	Water is removed slowly enough that the soil is wet at shallow depth for significant periods during the growing season.
drainage	P	Poorly	Water is removed so slowly that the soil is wet at shallow depths periodically during the growing season, or remains wet for long periods.

drainage VP Very Poorly

Water is removed from the soil so slowly that free water remains at or very near the ground surface during much of the growing season.

flodur	BRIEF	Flood Duration Class - Brief	Average duration of inundation per flood is 2 to 7 days.
--------	-------	---------------------------------	--

flodur	LONG	Flood Duration Class - Long	Average duration of inundation per flood is 7 days to 1 month.
--------	------	--------------------------------	---

flodur	VBREF	Flood Duration Class - Very Brief	Average duration of inundation per flood is less than 2 days.
--------	-------	--------------------------------------	---

flodur	VLONG	Flood Duration Class - Very Long	Average duration of inundation per flood is more than 1 month.
--------	-------	-------------------------------------	---

flood	FREQ	Frequency Class - Frequent	Flooding is likely to occur often, more than 50 percent chance of flooding in any year (at least 50 times in 100 years).
-------	------	-------------------------------	--

flood	NONE	Frequency Class - NONE	Flooding is not likely to occur.
-------	------	---------------------------	-------------------------------------

flood	OCCAS	Frequency Class - Occasional	Flooding is expected infrequently, 5 to 50 percent chance of flooding in any year (5 to 50 times in 100 years).
-------	-------	---------------------------------	--

flood	RARE	Frequency Class - Rare	Flooding unlikely but possible, 0 to 5 percent chance of flooding in any year (0 to 5 times in 100 years).
-------	------	---------------------------	---

hydgrp	A	Hydrology Class - A	High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.
hydgrp	A/D	Hydrology Class - A/D	Drained/undrained hydrology class of soils that can be drained and are classified.
hydgrp	B	Hydrology Class - B	Moderate infiltration rates. Deep and moderately deep, moderately well and well-drained soils with moderately coarse textures.
hydgrp	B/D	Hydrology Class - B/D	Drained/undrained hydrology class of soils that can be drained and are classified.
hydgrp	C	Hydrology Class - C	Slow infiltration rates. Soils with layers impeding downward movement of water, or soils with moderately fine or fine textures.

hydgrp	C/D	Hydrology Class - C/D	Drained/undrained hydrology class of soils that can be drained and classified.
hydgrp	D	Hydrology Class - D	Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.
hydric	N	NO	Soil does not meet the requirements for a hydric soil.
hydric	Y	YES	Soil meets the requirements for a hydric soil.
intensity	1	First Order Soil Survey	Scale - > 1:15840, Minimum Delineation - 1 ha or less, Consociations and some Complexes.
